

Prefect at the center of your pipelines

Why is failure recovery in your pipelines still a manual task? Automate resilience, not just the flow. 📦

The context

In modern orchestration (like Prefect), "state" is often a label in a remote database: Scheduled, Running, Failed. But for the engineer handling long-running or critical processes, a label isn't enough. You need the Context. You need to know exactly what was in memory at the moment of failure, so you don't have to start from zero.

Why engineers shift to wpipe

- Traditional approach: Generic retries or a full re-run (and the resulting waste of AI tokens or bandwidth).

Code-first

Pipelines are Python: versionable, testable, reviewable in Git.

Checkpoints

State persisted to SQLite WAL at every step; resume, don't restart.

Independently lean

<50MB RAM. No broker, no daemon, no metadata server.

What it looks like

```
from wpipe import Pipeline, step

@step(name="resumable", checkpoint=True)
def resumable(data):
    return {"state": hydrate(data["cursor"])}

pipe = Pipeline(pipeline_name="resilient", tracking_db="state.db")
pipe.set_steps([resumable])
```

At a glance

Feature	SaaS / Cloud Approach	wpipe (Sovereign) Approach
State Persistence	Metadata in an external DB	Atomic Data Context in SQLite WAL
Recovery	Task re-dispatch from server	Local-first state continuity
Complexity	High (Agent/flow management)	Minimal (`@step` decorator)
Reliability	Subject to orchestrator connectivity	Immune to external network failures

Under the hood

The flow behind the post, as wpipe renders it from code.

+117k downloads

A community of efficiency-first developers.

<50MB RAM

Fits containers, VMs, and Raspberry Pi-class hardware.

SQLite WAL

Industrial durability without a database to administer.

Next step

wpipe is a Python library — try it in your next pipeline:

```
pip install wpipe
```

Steps stay functions you already understand. Docs, diagrams, and dashboards follow. Explore Prefect workflows at wpipe.readthedocs.io.

wpipe · Python-native orchestration with SQLite WAL checkpoints, retries, timeouts, parallelism, and self-documenting flows. +117k downloads.
