

# Celery at the center of your pipelines

Is Celery Too Slow for Your Team?

## The context

Celery is the veteran of task queues, but its "Legacy" configuration can drag down your team's development speed. Do you really need a RabbitMQ cluster to orchestrate your microservices?  WPipe offers a modern experience, removing the friction of infrastructure.

## Why engineers shift to wpipe

- Pipelines are Python: versionable, testable, reviewable in Git.
- State persisted to SQLite WAL at every step; resume, don't restart.
- <50MB RAM. No broker, no daemon, no metadata server.

### Code-first

Pipelines are Python: versionable, testable, reviewable in Git.

### Checkpoints

State persisted to SQLite WAL at every step; resume, don't restart.

### Independently lean

<50MB RAM. No broker, no daemon, no metadata server.

## What it looks like

```
from wpipe import Pipeline, step

@step(name="job", retry_count=3, retry_delay=1)
def job(data):
    return {"result": worker(data["task"])}

pipe = Pipeline(pipeline_name="brokerless")
pipe.set_steps([job])

# Async-safe, but no Redis/RabbitMQ required.
```

## At a glance

| Feature       | WPipe           | Celery                |
|---------------|-----------------|-----------------------|
| Broker        | Not needed      | Redis / RabbitMQ      |
| RAM Footprint | < 50MB          | > 200MB               |
| Debugging     | Easy (Local DB) | Complex (Broker Logs) |
| Checkpoints   | Deterministic   | Simple Messaging      |

## Under the hood

---

The flow behind the post, as wpipe renders it from code.

<50MB RAM

SQLite WAL

A community of efficiency-first developers.

Fits containers, VMs, and Raspberry Pi-class hardware.

Industrial durability without a database to administer.

## Next step

wpipe is a Python library — try it in your next pipeline:

```
pip install wpipe
```

Steps stay functions you already understand. Docs, diagrams, and dashboards follow. Explore **Celery** workflows at [wpipe.readthedocs.io](https://wpipe.readthedocs.io).

wpipe · Python-native orchestration with SQLite WAL checkpoints, retries, timeouts, parallelism, and self-documenting flows. +117k downloads.
