

wpipe at the center of your pipelines

Transient errors shouldn't take down your pipeline

The context

An API responding slowly, a 2-second network timeout, a saturated DB connection... and your nightly job dies. Then you come in the morning to an empty log and "reprocess by hand." Transient failures are a fact of life in production. What's NOT normal is your architecture not tolerating them.

Why engineers shift to wpipe

- Pipelines are Python: versionable, testable, reviewable in Git.
- State persisted to SQLite WAL at every step; resume, don't restart.
- <50MB RAM. No broker, no daemon, no metadata server.

Code-first

Pipelines are Python: versionable, testable, reviewable in Git.

Checkpoints

State persisted to SQLite WAL at every step; resume, don't restart.

Independently lean

<50MB RAM. No broker, no daemon, no metadata server.

What it looks like

```
from wpipe import Pipeline, step

@step(name="my_step", retry_count=3, retry_delay=2, checkpoint=True)
def my_step(data):
    return {"result": process(data["input"])}

pipe = Pipeline(pipeline_name="my_pipeline", tracking_db="pipeline.db")
pipe.set_steps([my_step])
pipe.run({"input": [...]})

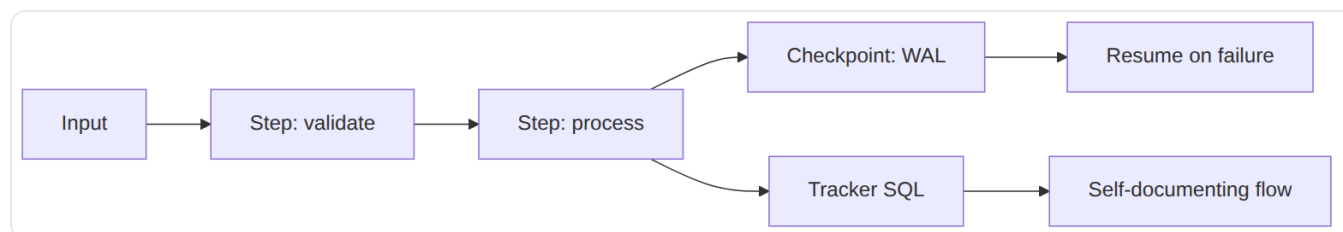

# Python-native orchestration: checkpoints, retries, self-documenting.
```

At a glance

Without retries	With wpipe
Fails and restarts everything from zero	Retries with controlled pause
Error at 3 AM, discovered at 9 AM	Error logged with its context
Fear of touching the script	You can iterate without risk

Under the hood

The flow behind the post, as wpipe renders it from code.

+117k downloads

A community of efficiency-first developers.

<50MB RAM

Fits containers, VMs, and Raspberry Pi-class hardware.

SQLite WAL

Industrial durability without a database to administer.

Next step

wpipe is a Python library — try it in your next pipeline:

```
pip install wpipe
```

Steps stay functions you already understand. Docs, diagrams, and dashboards follow. Explore **wpipe** workflows at wpipe.readthedocs.io.

wpipe · Python-native orchestration with SQLite WAL checkpoints, retries, timeouts, parallelism, and self-documenting flows. +117k downloads.
