

LUIGI PIPELINES, ENGINEERED

Luigi: Dependencies without the legacy lock-in.

Orchestration that scales with you.

<50 MB

RAM, total

SQLite

WAL state

Where it hurts today

Three things quietly cost teams time and trust every single week.

Last-mile
brittleness

No granular
resume

Sprawl in one
repo

wpipe turns these into code you control.

What you gain

Code-first

Pipelines are Python —
versionable, testable,
reviewable.

Resume, don't restart

Every step checkpoints
to SQLite WAL.

Featherweight

<50 MB RAM. No broker,
no daemon.

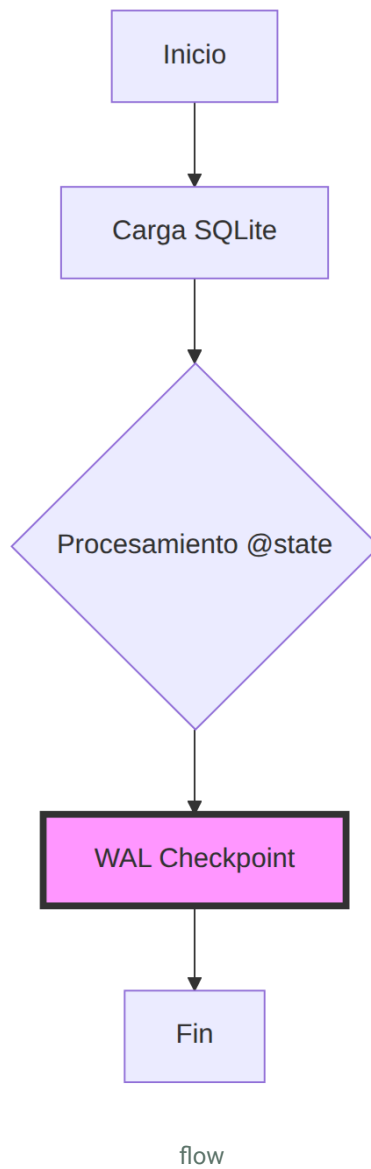

Crash at step 7? Resume from step 4.

Every step persists its state to SQLite WAL — a rerun cost you never pay again.

One pipeline, fully instrumented

State, retries, parallelism and audit — all inside the same run.

wpipe vs. the status quo

Feature	WPipe	Luigi
Data Integrity	SQLite WAL (Atomic)	File-system / Central DB
Scalability	Zero-infra, Edge Ready	Centralized Heavy
RAM Usage	< 50MB (Consistent)	> 2GB (Spiky)
Auto-Docs	Built-in Mermaid	Luigi Visualizer

Based on what the engineering community hits daily.

Answers four questions in one run ↘

Did it run, how far, what failed, and can it resume? Yes, yes, exactly, and automatically.

```
python my_pipeline.py
```

SEE IT IN ACTION

Six lines. That's the learning curve.

```
from wpipe import Pipeline, step

@step(name="build", retry_count=2, retry_delay=5)
def build(data):
    return {"out": compile_targets(data["src"])}

pipe = Pipeline(pipeline_name="luigi_like")

CHECKPOINTS · RETRIES · TIMEOUT · PARALLEL · TRACKER
```

Code-first

Pipelines are Python — versionable, testable, reviewable.

Resume, don't restart

Every step checkpoints to SQLite WAL.

Featherweight

<50 MB RAM. No broker, no daemon.

Try wpipe in your next pipeline

Install the library, wrap your step, and watch checkpoints and docs appear by themselves.

```
pip install wpipe
```
